

# Digital Signature Types

WAVE BL's digital signatures enable network members to sign documents and verify their authenticity electronically. Our signatures support any business activity and trade workflow, from simple agreement transfers to complex multi-party transactions involving title exchange.

With WAVE BL there is **no need to rely on third parties** for document verification.

Our service uses contact information verified by your **own** KYC (know your customer) workflow. Signatures from signed documents that are received via our platform are automatically compared to that approved contact information. If the received signature information is entirely identical to the contact information, the document verification process is complete.

Digital signatures can include declarations, comments and additional signed information. WAVE BL offers two different types of digital signatures to serve any business need:

## Blockchain-based digital wet-ink signatures

These signatures are unique to WAVE BL. Our wet-ink digital signatures **can never be removed**, add **timestamps** to documents and are critical for conducting **permanent transactions** such as transfers of title. Wet-ink digital signatures are used to issue and sign Bills of Ladings, bank guarantees, Bills of Exchange, bonds, certificates and other documents of title.

## Standard cryptographic signatures

Standard signatures are used for many documents, including invoices, agreements and cover letters, that require verification but not a verified timeline. WAVE BL implements the most cutting-edge cryptographic technology to sign and verify these documents.
